## ABSTRACT

In a portable radio communication apparatus including a housing,  
at least one part of the housing is formed as a housing electrical  
5 conductor portion by an electrically conductive material. The housing  
electrical conductor portion is connected with a radio communication  
circuit of the portable radio communication apparatus so as to operate  
as at least one part of an unbalanced type antenna of the radio  
communication circuit. Further, the portable radio communication  
10 apparatus further includes a boom portion coupled with the housing at  
least at two positions so as to provide at least one penetrating hole  
between the housing and the boom portion.
